

Dhan Webhooks for TradingView

Dhan Webhooks for TradingView enables you to leverage the power of [TradingView.com](https://www.tradingview.com) charts and Dhan together.

Dhan Webhooks work on TradingView via a feature called Alerts (or directly via Pine script). [TradingView Alerts](#) are immediate notifications when the market meets your custom criteria. These alerts also send notifications to the Dhan system if you configure the Dhan Webhook on the alert.

Pre-requisites:

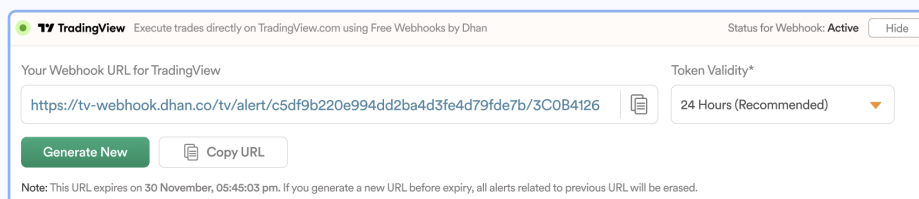

- Pro, Pro+ and Premium Membership of TradingView
- Dhan Trading Account

I. Configuring Webhook URL:

Step 1: Generating Webhook URL

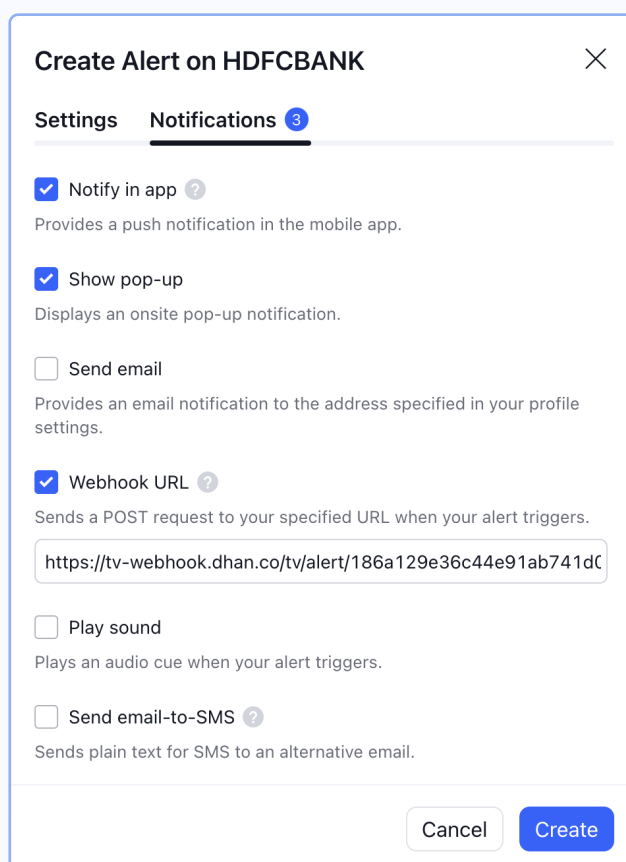

- Login to web.dhan.co
- Go to Orders > Webhooks

- Click on “Manage” under TV Webhook URL
- Generate a new Webhook URL (by clicking on “General New”) and Copy this URL

Step 2: Configuring Webhook URL on TradingView Alerts

- Login to [TradingView.com](https://tradingview.com)
- Open chart of the stock/instrument on which you want to place trade
- Add “Alert” by clicking on  Alert
- Click on “Notifications” and turn on “Webhook URL”
- Add the Webhook URL which you copied from Dhan here.

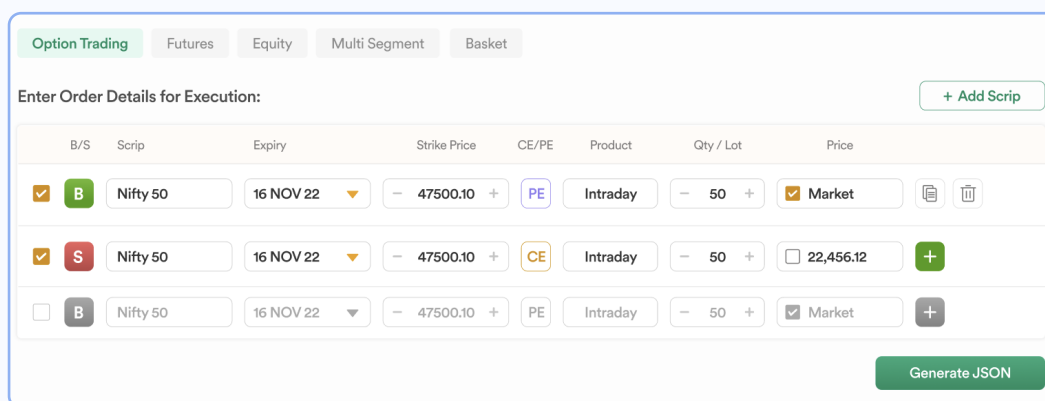

You can read more about Trading View Webhooks [here](#).

II. Generating Order JSON on Dhan:

With Dhan Webhook Order window, you can generate JSON as per your trading strategy for

- Equity
- Futures
- Options
- Commodity
- Currency
- Multi Segment
- Baskets

The screenshot shows the 'Enter Order Details for Execution' window in Dhan. It has tabs for 'Option Trading', 'Futures', 'Equity', 'Multi Segment', and 'Basket'. The 'Option Trading' tab is active. Below the tabs, there's a table with columns: B/S, Scrip, Expiry, Strike Price, CE/PE, Product, Qty / Lot, and Price. There are three rows of order details. The first row is for a Buy (B) order for Nifty 50, expiry 16 NOV 22, strike price 47500.10, PE, Intraday, Qty 50, and Price Market. The second row is for a Sell (S) order for Nifty 50, expiry 16 NOV 22, strike price 47500.10, CE, Intraday, Qty 50, and Price 22,456.12. The third row is for a Buy (B) order for Nifty 50, expiry 16 NOV 22, strike price 47500.10, PE, Intraday, Qty 50, and Price Market. There are checkboxes for each row. A '+ Add Scrip' button is in the top right. A 'Generate JSON' button is at the bottom right.

After creating your desired order, click on 'Generate JSON' to get a JSON object. Copy this JSON object.

Important Note: Each JSON has a 'secret' value which is mapped to your Webhook URL. Do ensure that whenever you are generating a new webhook URL, you change JSON objects in all your alerts accordingly.

III. Creating Alert with JSON:

Adding JSON on TradingView

- Open the Alert where you have added the Webhook URL.
- Paste the copied JSON object in the 'Message' box. Note: Ensure that all other text inside the message box is cleared and only JSON object is added.
- Click on 'Create' to successfully set the Alert.

Create Alert on SBIN

Settings

Notifications 2

Condition

SBIN, Regular trading hours

Crossing

Price 592.60

Trigger

Only Once

Every Time

The alert will only trigger once and will not be repeated

Expiration

August 12, 2023 at 11:35

Alert name

Message

```
{
  "transactionType": "B",
  "orderType": "MKT",
  "quantity": "1",
  "price": "0",
  "exchange": "{{exchange}}",
  "secret": "E4E8Z",
  "tradingSymbol": "{{ticker}}",
  "productType": ""
}
```

You can use special placeholders such as {{close}}, {{time}}, {{plot_0}}, etc.

Cancel

Create

Now, as soon as your Alert is triggered on TradingView.com, your order will be placed on Dhan. You can track your orders across all Dhan Platforms.

If you know PineScript coding on TradingView, you can use Dhan Webhook Orders to automatically generate alerts and trade directly, without manual intervention. Refer to Part IV instead of Part III to get started.

IV. Generating Alert with PineScript:

TradingView PineScript allows you to create Alerts automatically based on your indicator condition. Using the Alert() function in PineScript, you can create alerts based on specific defined conditions and add desired message [Read more about [Alert function](#) here].

Creating Alert via Indicator condition:

```
if [Condition 1]
    strategy.entry("Long", strategy.long, stop = high,
        alert_message = "JSON Message")
else if [Condition 2]
    strategy.entry("Short", strategy.short, stop = low,
        alert_message = "JSON Message")
```

Here, [Condition 1] & [Condition 2] needs to be defined earlier which will define when the Alert is triggered.

`alert_message` needs to be JSON Message as generated in Part II.

This is only for entering a position. You will have to write a similar message for exit position as well if you wish to create separate conditions for exit.

Now, you will need to enter following in Alert message box:

`{{strategy.order.alert_message}}`

Note:

- Ensure that the Webhook URL is valid whenever you are placing alerts. Also, replace Webhook URL once the existing one is expired.
- Whenever you are generating a new Webhook URL or replacing a Webhook URL, you need to ensure that the JSON object inside Alert on TradingView is also replaced, as the Webhook URL is mapped to the 'secret' inside JSON object.
